README

Description: The File System is a program that performs tasks surrounding managing files and directories. Some of these operations include creating a file, opening a file, deleting a file, etc.

As a user you are able to select from these various operations to control files how you would like. Also, it is important to note that the file system also logs the information or changes you provide. For example, when you create a file you will be provided the time and date that you created the file. Essentially, the File System will be a slightly lesser representation of the actual Linux File System.
